EXPORT

IMPORT AND VALIDATE

- **Text or CSV intake:** extract proposed fields from pasted text, or import up to 500 CSV rows / 1 MB. No AI service is required.
- **Fields:** vendor/payee, document number, date, subtotal, tax, total, account code, department, and notes.
- **Configurable rules:** required fields, currency, accounts, departments, approval limit, and arithmetic tolerance.
- **Exception checks:** missing fields, invalid dates/cents, nonpositive totals, bad codes, amount limits, reconciliation, and potential duplicates. Exact reimports reuse the original record.

REVIEW AND EXPORT

- **Human review:** search/filter the queue; inspect source text, parser warnings, and change history; correct, reject with a reason, or reopen records.
- **Approval controls:** authenticated contributors cannot approve their own imports or corrections. Edits and rule changes clear approvals; stale revisions are rejected.
- **Durable export:** admins export approved records to a saved CSV snapshot. Exported records lock; snapshots remain downloadable. Spreadsheet formula text is escaped.

SIMULATED ACCOUNTING HANDOFF

- Local modes can send exports to a **separate mock ERP**, reconcile its receipt, and retry the same batch without duplicate posting. This is a demonstration connector.

ACCESS AND SAFEGUARDS

- **Roles:** viewers inspect; reviewers import and review; admins also configure rules and export. Audit actors come from signed-in identities.
- **Authentication:** hashed passwords, server-side sessions, expiry, logout, and revocation on password reset or account disable.
- **Request protection:** role checks, CSRF tokens, origin/host checks, secure production cookies, browser security headers, and bounded inputs.
- **Traceability:** document changes, approvals, exports, and account/login activity are recorded. Imports and exports use database transactions.

RUN AND RECOVER

- **Single organization per database:** SQLite persistence, schema checks, pre-upgrade snapshots, and verified online backups with recovery instructions.
- **Three modes:** isolated loopback demo; authenticated local testing; or Waitress behind a configured HTTPS reverse proxy. JSON API and deployment guide included.

TESTED RELEASE

- **29 Python tests** on Windows/Linux; browser workflow, mobile layout, and production startup checks.
- **Closed pilot kit:** 11 invented cases; 8 approved export rows totaling **\$638.00**; expected results, walkthrough, scorecard, and restore verification.

CURRENT LIMITS

Text/CSV only. No PDF/image OCR, Excel import, live accounting connector, AI/MCP integration, multi-tenant hosting, SSO/MFA, or external tamper-resistant audit storage. Real operational use still needs target-system validation and deployed TLS, monitoring, and off-host backups. Maintained as time permits; support is not guaranteed.

TRY IT `python -m ledgerbridge.server --local-demo`

Open `http://127.0.0.1:8765` | Isolated acceptance: `python -m pilot.run`
